TACEDGE

TACEDGE × HUNTER CIVIL

INITIAL SCOPING CONVERSATION

For **Julian Fairmaid** · Operations Manager, Hunter Civil
15 July 2026

Shared Clarity.

For ground-engineering delivery.

Exploring a simpler connection between field delivery, QA and reporting.

THE CURRENT WAY

Field data becomes project overhead.

- Field records arrive fragmented—or go missing.
- Project managers spend hours chasing, entering and reconciling the data into reports.
- Engineers receive delayed, reconstructed reports that are hard to verify.

Project managers should assure the work—not assemble the report.

TACEDGE removes the clerical compilation. The project manager keeps quality assurance, exception review, judgement and controlled release.

WORKFACE	→	PROJECT MANAGER	→	ENGINEER
Fragmented field data		Entered and compiled		Reconstructed report
Paper · forms · apps · calls · photos		Logs · spreadsheets · reports		Delayed · incomplete · hard to verify

ONE CONNECTED WORKFLOW

1 Configure

Set the project up once.

Define the work, sequence, testing and evidence requirements before it reaches the field.

2 Capture

Record the work where it happens.

Operators capture drilling, installation, grouting, testing, incidents and daily activity through simple field workflows.

3 Confirm

Review and release.

The project manager reviews evidence and exceptions before releasing a trusted report.

ONE WORK ITEM. ONE CONNECTED RECORD.

Setup, field activity, QA and release remain connected from the workface through to closeout.

Configured → Captured → Confirmed

Built first for anchoring and drilling. The same connected-record model can be configured around adjacent specialist workflows.

WHAT WE WANT TO UNDERSTAND

01 Where is the greatest friction between field capture, QA and reporting?

02 What would make adoption practical for crews and project managers?

03 Is there one narrow workflow worth validating together?

A POSSIBLE NEXT STEP

- → Identify one workflow.
- → Configure it with Hunter Civil.
- → Validate it on real work.
- → Decide from evidence.

A small, jointly defined validation—not a broad rollout.
