

Shared Clarity.

For ground-engineering delivery.

TACEDGE is a field platform for ground-engineering delivery – one connected workflow from project setup to a smarter next project.

WHAT TACEDGE DOES

A project is configured once. Operators capture drilling, installation, grouting, testing and incidents where the work happens. The project manager reviews evidence and exceptions and releases a trusted report – and every confirmed record improves the setup of the next project.

VALUE PROPOSITION

- 
One work item. One connected record.
 Setup, field activity, QA and release stay connected from the workplace to closeout.
- 
Assurance, not admin.
 Project managers assure the work—not assemble the report. Engineers and clients receive confirmed, evidence-backed reports.
- 
Compounding learning.
 Confirmed records improve future project layouts, checks and recommendations.

WHERE WE ARE

- 
V1 live across desktop and field mobile – configure, capture, QA and release end to end.
- 
V2 under development to support scaling.
- 
Used on recent ground-engineering delivery in New Zealand – see the site video.
- 
Built first for anchoring and drilling – adaptable to adjacent ground-engineering workflows.
- 
Early interest received from Australian ground-engineering companies.
- 
Born on the 2019 Whakaari / White Island recovery operation.
 Mission: to bring shared clarity to the tactical edge.

ONE CONNECTED WORKFLOW

1 Configure

Set it up once.

2 Capture

Record work where it happens.

3 Confirm

Review and release.

4 Compound

Start the next project smarter.

 **The loop closes:** every confirmed record improves the next configuration.
